A.I. Chat with Business Data Pilot Deployment

Artificial Intelligence (A.I.) is the big buzzword around, and organizations have started using A.I. to chat with "documents". However the big next step leap is chatting with DATA (databases: sales, financial, supply chain, manufacturing, student/academic data, healthcare data, research, etc). A.I. Agents to business data hasn't been as forthright to build and get meaningful results, however Convergent Computing (CCO) has distilled the process to make chatting with business data a functional knowledge solution in under 2-weeks!

This service offering by Convergent Computing:
- Helps organizations expand beyond CoPilot and basic Chatbots of files to the whole new area of A.I. chats with business DATA!
- Builds a live environments in YOUR private Microsoft Cloud within 2-3 weeks!
- Costs (~$300-$500/month) to Microsoft for the runtime cost of this private A.I. Agent and PostgreSQL database solution that can be used by 1, 10, 100, 1000+ users in the org – No long term contracts or user subscriptions to purchase, can uninstall the implementation in under 1-hour with no further charges incurred
- Includes implementation/setup WITH most of the time spent helping business users select the business system (data) that'll be initially imported into PostgreSQL on Azure and helping the users ask "good questions" of the A.I. Agent to uncover insight for forecasting, trends, projections, analysis, and cross-data comparisons.
- CCO recommends the allocation of $10,000 in budget so that there are hours available to do the implementation/setup (first $5k-$6k) and then provide assistance (on an hourly basis against this budget) in working with business users and creating additional A.I. Agents, Chatbots, and business system integrations

Total length of time of the typical engagement is 2-3 weeks that involves:
- Kick-off Intro of the Proof of Concept / Pilot Engagement
- Convergent Computing (CCO) to setup the AzureAI and PostgreSQL services in your Microsoft Azure cloud environment
- Mutually agreeing on an initial dataset that'll be ingested and tested in the AzureAI/Chat environment
- A CCO business analysis will then assist typically 2-3 pilot users in formulating "good" questions to ask the A.I. Agent and how different phrasing results in better results, building the business-side foundation of getting the most out of A.I. Chats to business data.

Starts with a FREE (no obligation) <u>30-minute Microsoft Teams meeting</u> that covers:
- **Live demo of what A.I. Chats with business data looks like and what the solution will do to help organizations uncover using an A.I. Agent to business data**
- **Clarification of how this solution differs from anything CoPilot or ChatGPT does**
- **Demo / real world examples how over 150 organizations are already leveraging the A.I. solutions created by Convergent Computing (CCO)**

Leap beyond the typical theoretical talk about A.I. and get real world insight and experience with the latest in A.I. where you can CHAT with your business data!
